

Bird-Friendly Building

Solutions for a healthy, sustainable future

FACTS AT A GLANCE

NEARLY 1 BILLION

birds are killed annually in the United States due to window collisions.

OVER 20 CITIES

have passed laws requiring bird-friendly building standards, including New York City and San Francisco.

DOZENS

of effective strategies for preventing bird collisions.

\$107 billion

produced by birdwatching activities annually, involving over 47 million people. Window collisions are a major cause of bird mortality in the United States. New bird-friendly building technologies are effective and affordable, providing important co-benefits for human health, energy efficiency, ecological resilience, and savings.

VALUING BIRDS

Birds are unique in their ability to inspire us: like humans, they are smart, social, and wherever humans live, they are some of the easiest animals for us to see and connect with. We depend on birds for many ecological services, including pest control and plant pollination. Constructing buildings that support birdlife invites us into imaginative and holistic design—as well as the recognition that not only do birds have a right to exist, but their continued existence is a value to humanity.

A CLEAR PROBLEM

Collisions occur when birds mistake a glassy, transparent surface for habitat and fly into it, resulting in injury or death. The toll is staggering: one billion birds are killed every year due to window strikes in the United States. Collisions can happen at structures of all heights and shapes, on glazing facing in all directions, during all seasons, and under all weather conditions. But generally, the amount of glazing on a building is the strongest predictor of risk to birds. Lighting and landscaping also play a role in attracting birds to risky areas.

"A building isn't green until it's bird friendly."

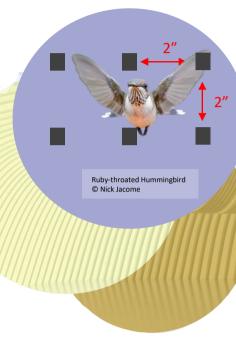

- Michael Mesure, Founder, FLAP Canada

BIRD-FRIENDLY SOLUTIONS & TECHNOLOGIES

Fortunately, there are many ways to protect birds from collisions in both new construction and existing buildings. Strategies to make buildings bird-friendly allow for wide variety and flexibility in materials and styles, without sacrificing appearance, light, or view clarity. The cost of adding bird-friendly glazing typically adds only a fraction of one percent (<0.5%) to overall construction costs.

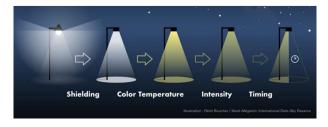

Façade & Glazing

Glass is the main culprit behind bird collisions. Strategies to make glass and other transparent/ reflective materials more visible to birds can drastically reduce collisions. These include the use of glazing treatments and visual markers, such as ceramic frit, etching, colors, textures, opacity, and UV materials on glass—as well as architectural details that partly obscure glazed surfaces, such as exterior shades, screens, shutters, stainless-steel detailing, and wire mesh. Reducing the total amount and size of glass sheets helps. Glazing patterns should follow American Bird Conservancy's 2" x 2" rule. For retrofits, vertically hung twine, lightweight netting, and/or decals can be applied to existing glass. Exterior glass surfaces should be treated to at least 60 feet above grade or to the top of the mature tree canopy, whichever is higher.

Quality Lighting

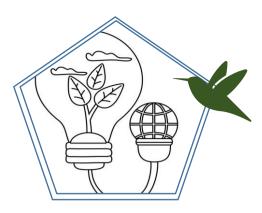

Artificial light acts as a beacon for billions of birds that migrate twice yearly at night. When birds fly toward intensive skyglow, they can be lured into dangerous urban environments, where they are vulnerable to exhaustion, disorientation, and injuries like collisions. Light pollution also negatively impacts human health. Shielding lighting fixtures and responsible use of lighting control technologies reduce light pollution.

Landscaping

Vegetation-rich landscaping can provide important habitat for birds, especially green roofs, but it can also increase the risk of collisions if nearby glazing is left untreated. Improving habitats for humans, birds, and other species *without* bird collision deterrence can create traps for birds. Carefully consider landscaping plans to maximize benefits for birds and people, while reducing collision hazards. Plant trees within 3' or more than 30' of a structure.

Whatever is good for birds is good for people—clean air, clean water, healthy habitats. Actions we take to protect birds can improve human health outcomes, while helping us meet our climate goals as we transition to Net Zero. Bird-friendly building design provides farreaching co-benefits for energy efficiency and ecosystem stabilization. Transformational changes are needed in how we live and envision our built environments to avoid the worst effects of the climate emergency. By choosing solutions with co-benefits across threats, we can make holistic progress toward a healthy, sustainable, compassionate world.

Restore Our Inter-Relationship

with Nature

Disease Risks

Support Psychological & Cognitive Wellbeing

At the heart of green building is our desire for closer connection with nature, including use of glass that respects life.

Limiting light pollution can decrease elevated urban risk of obesity, depression, heart disease, and breast cancer.

Seeing or hearing birds and increased landscape biodiversity—are associated with lasting improvements in mental health and wellbeing.

Thermal Comfort

Better Rest/Sleep

Increase **Energy** Efficiency 25%

Reduce **Energy** Use 60-70%

Strengthen **Ecosystem** Resilience

Glass coatings reduce solar gains, heat/cooling requirements, and need for artificial lighting, while offering an effective way to reduce embodied carbon. More sparing use of glass also increases building envelope efficiency.

Quality lighting design reduces energy use and carbon emissions. LEDs still carry large embodied carbon load; so, good design uses less lighting.

Birds are an integral part of a healthy ecosystem, helping maintain balance while performing crucial ecological services, such as pest control, pollination, and soil fertilization.

Encourage Creativity & Innovation

Light pollution disproportionately burdens racial/ethnic minority and low-to-mid socioeconomic status neighborhoods.

Restore the **Night Sky**

Green Spaces

Green Spaces provide access to outdoors—while increasing social engagement and a sense of community and belonging.

Bird-friendly design lends itself to art and creativity, including invention and engineering of new glazing techniques and materials.

"Instead of trying to hide the bird-friendly part, use it, make a statement with it. It doesn't have to be dots and stripes."

Christine Sheppard,
 American Bird Conservancy

EXEMPLARY

BIRD-FRIENDLY GREEN BUILDING **DESIGNS**

Brooklyn Botanic Garden

Brooklyn, NY

Architect Firm: Weiss/Manfredi

Type: Visitor center Sq ft: 22,000

Bird-friendly features: Patterned glass, abundant

(native) landscaping

Green features: High-energy performance, natural

light, green roof, rainwater harvest

Certification: USGBC LEED Gold

Loblolly House

Taylor's Island, MD

Architect: Kieran Timberlake Type: Private residence

Sq ft: 2,200

Bird-friendly features: Screens, staggered rainscreen

siding, exterior shades over glazing
Green features: Energy conservation, highperformance energy systems, solar orientation,
minimal footprint, recyclable building materials

West Bank Station

Minneapolis, MN

Artist: Nancy Blum Type: Mass transit station Sq ft: 334 of etching

Collision deterrence: 1/8" stainless steel panels and

stainless wire mesh with etched images

CERTIFICATION

To date, no sustainable building program requires the use of bird-friendly building principles for certification. However, the U.S. Green Building Council offers property owners one point towards its LEED certification program for following its 'Bird Collision Deterrence" protocols, which regulate façade and lighting. The credit became part of the USGBC's permanent Library of Innovation Credits in 2022. To some, this credit is largely an appeal to enlightened self-interest, saving birds while reaping the financial benefits of green building.
